0x45.dev

BUILD LOG #3 · PIPELINE

One video a day, automatically

How the 0x45.dev channel turns GitHub trending into a ready-to-post video every evening at 6 PM, **and why a human still presses Post.**

6:00 PM DAILY | 6 STEPS | HUMAN POSTS

WHILE I'M AWAY

The 6 steps

⭐ **STEP 1 • Pick**

Open GitHub trending; take the project with the most new stars today.

🚫 **STEP 2 • Filter**

Skip anything shady, and anything already covered.

📸 **STEP 3 • Capture**

A hidden browser screenshots the README in dark mode and maps every heading and paragraph.

✍️ **STEP 4 • Script**

Claude writes a 60-80 word script; every claim must come from the README or GitHub's data.

🎙️ **STEP 5 • Voice**

My cloned voice reads it; Whisper listens back and redoes unclear lines.

✅ **STEP 6 • Render + QA**

Video renders; a checklist tests loudness, captions, layout, and more.

PICK · FILTER · CAPTURE

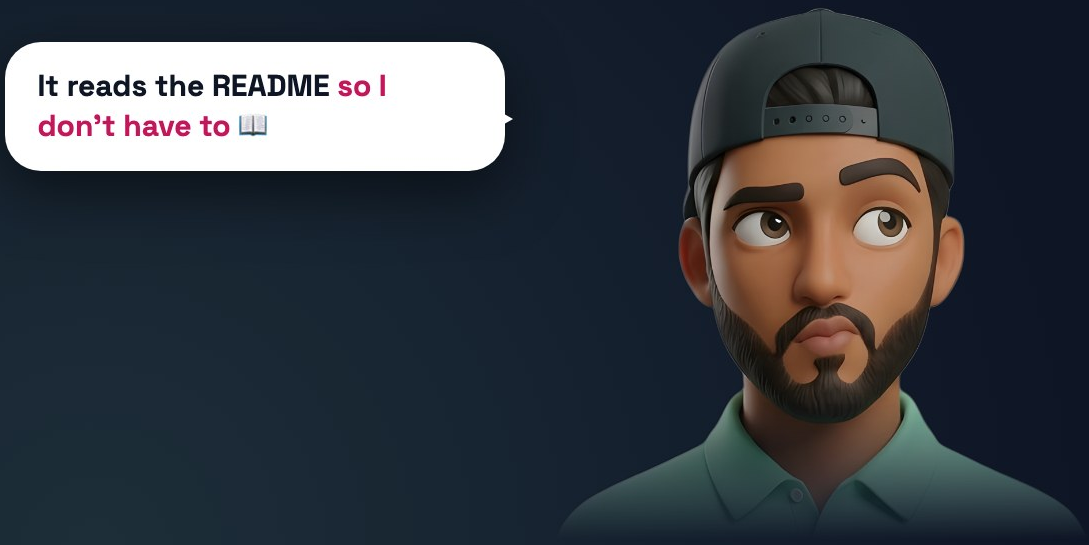

Find today's project

```
PICK RULE
trending = github.com/trending?since=daily
pick = max(stars_today) where not covered and not blocked
```

Blocked: adult content, piracy and "free download" lists, malware, crypto pump schemes. **Covered:** a table of every repo already made into a video, so nothing repeats.

The README is captured by headless **Chrome** over the DevTools protocol: dark mode, logged out, a throwaway profile. It records where each heading and paragraph sits, so the video can scroll to and **highlight** the exact part being talked about.

> 💡 Only public pages, logged out. Never anyone's private data.

SCRIPT · VOICE · QA

Make it, then check it

Script template: stars hook → what it is → "here's how it works" → 2-3 beats, each with one number and one comparison → "but here's the catch" → payoff → "Comment REPO for the link".

Rule: every claim lists its source (README section, GitHub API, trending page). No hype, no guesses.

Voice: slow pace, 0.4 s pauses. Big numbers get rounded ("over 600") because text-to-speech garbles them.

QA CHECKLIST

- ✓ loudness -14 LUFS · true peak ≤ -1
- ✓ captions match the script (Whisper)
- ✓ captions inside the safe zone, never on the face
- ✓ no frozen or look-alike stretches

WHAT RUNS IT

The pipeline stack

Claude Code `scheduled task`

Runs every day at 6 PM, picks, writes, checks, fixes.

`claude.com/claude-code`

Headless Chrome `DevTools`

README screenshot + heading positions.

`chromedevtools.github.io`

Chatterbox + Whisper `MIT`

Cloned voice, then checked by ear (AI ear).

`github.com/resemble-ai/chatterbox`

Remotion `free for individuals`

The video template, rendered to MP4.

`remotion.dev`

The full avatar and media stack is in the **STACK** and **AVATAR** guides (comment those words on Build logs #1 and #2).

HUMAN IN THE LOOP

It never posts by itself

Every evening the finished video lands in a **ready-to-post** folder with the title, caption, hashtags, pinned comment and cover. I watch it, then press **Post** myself.

AUTO-POST	KIT + BUTTON
✗	✓
mistakes go live while you sleep	10 seconds of checking, then post

0x45.dev ✦ AI

A trending repo, every day. **Follow @0x45.dev**
